

Debugging the file Standards.fmp12

Hi,

I'm new here and not sure where and how to report this/make a change request.

I have found two small bugs in the Standards.fmp12 file, of which I have already reported the first one in the Goggle Mailing list:

1) Function in @Startup Layout

```
« $$FMP.VERSION.REQUIRED = 12.02; »
```

generates an error on foreign systems with a comma decimal separator.

I would suggest a comment like // please use 12,02 if your system uses comma decimal separators

Anything else would be overkill, I fear. Like: « GetAsNumber ("12" & Left (1/2 ; 1) & "02") » // ;-)

2) Script: «Developer Save Backup»; Step: « Set Variable [\$path; Value:...] »; Line: « ~filename = \$timestamp & Get (FileName) & ".fp7"; »

Hard coding the «.fp7» isn't a good idea, as it will generate an error when you open the file i.e. in FMP12.

My suggestion: Add another global variable in the @Startup Layout function:

```
$$FMP.FILEVERSION = RightWords ( Substitute ( Get ( FilePath ) ; "." ; " " ) ; 1 );
```

or you could make a function. Actually, I believe it should be part of FMP's Get functions « Get (FileVersion) »

Thanks!
