Best Practice

I like to propose a new section **Best Practice** besides **Coding Standards**.

Some ideas or discussions in **Coding Standards** are already belong more into **Best Practice** than **Coding Standards**, like using UUID for primary key fields, or systems to use for passing script parameters.

I understand, there is not always a clear line between both sections. But consider this, when you rely on custom functions, you need FileMaker Pro Advance. But the **Coding Standard** should apply to simple FileMaker Pro users as well.

Perhaps we can mention certain features in **Coding Standards** and add a link to **Best Practice** for further explanation and discussion.

Some items I would rather put into **Best Practice**:

- Field CLIPBOARD
- Custom function UUID (done)
- Script parameter system
