IsMac Custom Function

It's a pretty simple function, but it's like the Null custom function; it's main purpose is to clarify the code. A calculation becomes self-documenting when you can use...

\[ \text{IsMac} \]

instead of

\[ \text{Abs(Get(SystemPlatform)) = 1} \]

It may be best to also create an IsWindows function. I would be happy with using \text{not IsMac} rather than creating another CustomFunction, but I think that's debatable. If only one of the two functions is to be created, I prefer \text{IsMac} simply because it's shorter and quicker to type.
