

Layout naming

- **Layouts:** are prefixed according to their use within the solution. Prefixes, of which there can be multiple levels, are delimited by a single colon. Suggested approach is to use the "base table" name as the initial prefix.

People: Customer List	good
People: Customer Search	good
People: Customer Detail	good
Events: Utility: Copy All Records	good

Layout objects

- **Layout objects:** are prefixed by their corresponding reserved name and use a dot separator. The dot identifies them as layout objects within calculation code. The number of levels used is currently arbitrary based on the solution.

- Reserved object prefixes are the following

- field
- label
- tab
- button
- portal
- webview
- chart

field.customerName	good
portal.sideBar	good
webview.help	good
