

Variable naming

- **Variables:** locally scoped variables (`$variableName`) use lower camelCase. Similar to fields, it's the `$` which distinguishes them within calculation code.

<code>\$variableName</code>	good
<code>\$variablename</code>	bad
<code>\$variable_name</code>	bad

- **Variables:** global variables (`$$VARIABLE.NAME`) are capitalized and use domain specific prefixes relevant to their functional use within the solution. Each level of the domain is delineated using dot notation (a period).

<code>\$\$APP.SETTINGS.ACCESSLEVEL</code>	good
<code>\$\$APP.SETTINGS.LANGUAGE</code>	good
<code>\$\$USER.PREFERENCES.CUSTOMER.DISPLAY</code>	good
